AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claim in the application:

RV

1. (Currently amended) A method for inspecting thermal
equipment, comprising the steps of:

fetching information related to <u>an</u> operating state of thermal equipment via a communication line into an information processing device provided at a management center connected via the communication line to a facility site which is equipped with the thermal equipment and which is under a specified contract for the thermal equipment;

making the information processing device execute creation of report data for use of inspection recording related to an inspection of the thermal equipment as well as delivery of the created report data to the facility site; and

outputting from an output device a report based on the report data delivered from the information processing device at the facility site.

2. (Currently amended) The method for inspecting thermal equipment according to Claim 1, wherein said step of fetching the information related to the operating state of the thermal equipment is fetched into the information processing device occurs at a specified time point.

3. (Currently amended) The method for inspecting thermal equipment according to Claim 2, wherein further comprising the steps of:

storing the report data is stored in a data storage device at
each time of during a creation of the report data, and

executing by the information processing device executes \underline{a} creation of \underline{a} total report data for \underline{a} the specified period at which the stored report data is to be totaled as well as delivery of the created total report data to the facility site, and

outputting, while at the facility site, a total report of the specified period based on the total report data delivered from the information processing device is outputted from the output device.

4. (Original) The method for inspecting thermal equipment according to Claim 2, wherein in event of occurrence of an abnormality of the thermal equipment, abnormality information on the

ANY

thermal equipment is fetched into the information processing device, and the fetched abnormality information is included in the report data.

5. (Currently amended) The method for inspecting thermal equipment according to Claim 4, wherein further comprising the steps of:

storing the report data is stored in a data storage device
at each time of creation of the report data is created, and

executing by the information processing device executes a creation of a total report data for a the specified period at which the stored report data is to be totaled as well as delivery of the created total report data to the facility site, and

outputting, while at the facility site, a total report of the specified period based on the total report data delivered from the information processing device is outputted from the output device.

6. (Original) The method for inspecting thermal equipment according to Claim 1, wherein the information related to operating

state of the thermal equipment is fetched into the information processing device at a specified time interval.

- 7. (Original) The method for inspecting thermal equipment according to Claim 6, wherein the report data is stored in the data storage device at each time of creation of the report data, and the information processing device executes creation of total report data for a specified period at which the stored report data is to be totaled as well as delivery of the created total report data to the facility site, while at the facility site, a total report of the specified period based on the total report data delivered from the information processing device is outputted from the output device.
- 8. (Original) The method for inspecting thermal equipment according to Claim 6, wherein in event of occurrence of an abnormality of the thermal equipment, abnormality information on the thermal equipment is fetched into the information processing device, and the fetched abnormality information is included in the report data.
- 9. (Original) The method for inspecting thermal equipment according to Claim 8, wherein the report data is stored in a data storage device at each time of creation of the report data, and the

Any

information processing device executes creation of total report data for a specified period at which the stored report data is to be totaled as well as delivery of the created total report data to the facility site, while at the facility site, a total report of the specified period based on the total report data delivered from the information processing device is outputted from the output device.

- 10. (Original) The method for inspecting thermal equipment according to Claim 1, wherein in event of occurrence of an abnormality of the thermal equipment, abnormality information on the thermal equipment is fetched into the information processing device, and the fetched abnormality information is included in the report data.
- 11. (Original) The method for inspecting thermal equipment according to Claim 10, wherein the report data is stored in a data storage device at each time of creation of the report data, and the information processing device executes creation of total report data for a specified period at which the stored report data is to be totaled as well as delivery of the created total report data to the facility site, while at the facility site, a total report of the

My

specified period based on the total report data delivered from the information processing device is outputted from the output device.

- 12. (Original) The method for inspecting thermal equipment according to Claim 1, wherein the report data is stored in a data storage device at each time of creation of the report data, and the information processing device executes creation of total report data for a specified period at which the stored report data is to be totaled as well as delivery of the created total report data to the facility site, while at the facility site, a total report of the specified period based on the total report data delivered from the information processing device is outputted from the output device.
- reducing personnel and human error during required periodic inspections of thermal equipment, said system to be built between a facility site, which is equipped with the thermal equipment and which is under a specified contract for the thermal equipment, and a management center which serves for maintenance and management of the thermal equipment, the system comprising:
- a communication line for connecting the facility site and the management center to each other;

Argund

an operating-state information collecting device, provided at the facility site, and serving for collecting information related to operating states of the thermal equipment;

a facility-side modem interposed between the operating-state information collecting device and the communication line;

an information processing device which is provided at the management center and which fetches for fetching the information related to the operating state states of the thermal equipment via the communication line and further which executes for executing a creation of report data for use of inspection recording, the inspection recording related to an inspection of the thermal equipment as well as delivery of the created report data to the facility site;

a <u>management</u> center-side modem interposed between the information processing device and the communication line; and

an output device which is provided at the facility site and which serves for outputting a report based on the delivered report data.

14. (Currently amended) The system for inspecting thermal equipment according to Claim 13, wherein the system further comprises comprising a data storage device for storing therein the

Ar

report data at each time of creation of the report data has been created, and wherein the information processing device is being capable of executing creation of total report data for a specified period at which the report data stored in the data storage device is to be totaled as well as delivery of the created total report data to the facility site, while at the facility site, the output device is capable of outputting a total report of the specified period based on the total report data delivered from the information processing device.

- 15. (Original) The system for inspecting thermal equipment according to Claim 13, wherein in event of occurrence of an abnormality of the thermal equipment, the information processing device is capable of fetching abnormality information on the thermal equipment and making the fetched abnormality information included in the report data.
- 16. (Currently amended) The system for inspecting thermal equipment according to Claim 15, wherein the system further comprises comprising a data storage device for storing therein the report data at each time of during creation of the report data, and wherein the information processing device is capable of executing

Any

creation of total report data for a specified period at which the report data stored in the data storage device is to be totaled as well as delivery of the created total report data to the facility site, while at the facility site, the output device is capable of outputting a total report of the specified period based on the total report data delivered from the information processing device.
